Composition useful for treatment of mycoplasma infection and diseases associated with cell proliferation e.g. malignancy or with co-infection with another microbe, comprises agent inhibiting sialic acid-mediated attachment of mycoplasma.

Claim 6; Fig 26; 63pp; English.

The invention relates to a composition useful for treating or preventing mycoplasma infection in a subject suffering from a disorder characterised by increased cell proliferation or by co-infection with a second microbe, comprising an agent that prevents or inhibits sialic acid-mediated attachment of mycoplasma to the subject's cells. The activity of

```
antibacterial, antiviral, mit. HIV, cuestatic and vasotropic. The compositions are useful to treat diseases associated with undesirable cell proliferation, such as atherosclerotic vascular disease and malignancy, by reducing or preventing mycoplasma infection. Examples of colon cancer, lung cancer and leukaemia. They are also useful to treat diseases associated with infection with other infections organisms co-courring with mycoplasma (and typically increasing the virulence of both pathogens), especially human immunodeficiency virus or chlamydia species. They can be used to treat such diseases in humans or other animals, and can be administered in conjunction with conventional agents e.g. antiplatelet or chemotherapeutic agents. The current sequence represents the catalytic trans-sialidase unit of T. cruzi amino acid sequence

Mycoplasma infection for manufacturing a medicament for treating a disorder associated with increased cell proliferation or a co-infection with mycoplasma and a second microbe. Mycoplasmas are parasites of the respiratory epithelium and ucrobe. Mycoplasmas are parasites of the respiratory epithelium and ucropental tract. Infections are typically asymptomatic but they seem to be co-factors in diseases such as AIDS and in sequelae after mycoplasma infections having an autoimmune basis. The agent prevents or inhibite sialic acid-mediated attachment of mycoplasma correct consisting of neuraminidase and/or trans-sialidase acitivity. The activity consisting of neuraminidase and/or trans-sialidase acitivity. The caryme is derived from a Trypanosoma cruzi microorganism, where the enzyme is a native or a recombinant enzyme. Results showed that trans-sialidase is effective as a drug in the treatment of neoplasma; removing mycoplasmas from the neoplastic cells leading to their apoptosis. The composition or the agent that prevents or inhibits mycoplasma infection is useful for manufacturing a medicament for treating or preventing a disorder associated with increased cell proliferation, e.g. charcoslerotic vascular disease or malignant disease (tumour), or a disease associated with increased cell proliferation, e.g. cuch as human immunodeficiency virus or a Chlamydia microbe. The sequence cuch as human immunodeficiency virus or a Chlamydia microbe. The sequence composition and a second microbe composition and a second microbe composition and a second microbe composition are a chlamydia microbe. The sequence composition is the variant T. cruzi trans-sialidase enzyme. The invention discloses the use of an agent that prevents or inhibits Query Match

The present sequence represents Trypanosoma cruzi alpha(2-3) trans-
c sialidase. The protein is used in the method of the invention to produce
sialyl-oligosaccharides, particularly sialylactose, which are produced
by treating a dairy source such as a cheese processing waste strain with
c an alpha (2-3) trans-sialidase. The method can be used for producing
c sialyl-oligosaccharides, such as (2-3) sialyllactose for pharmaceutical
cuse. (2-3) sialyllactose has been shown to neutralise enterotoxins of
c various pathogenic microbes including B. coli, vibrio cholerae and
c Salmonella. It has also been shown that alpha(2-3) (2-3) sialyllactose
c (alpha-Neu5Ac-(2-3)-Gal-beta-(1-4)-Glc) interferes with colonisation of
thelicobacter pylori and thereby prevents or inhibits gastric and duodenal
c ulcers. (2-3) sialyllactose has additionally been proposed to inhibit
c immune complex formation by disrupting occupancy of the Pc carbohydrate
binding site on IgG and to be useful in treating arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           140

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a functional Trypanosoma cruzi alpha(2-3) trans-sialidase which lacks amino acid repeats. The protein is used in the method of the invention to produce slall-oligosaccharides, particularly slaly/lactose, which are produced by treating a dairy source such as a cheese processing waste strain with an alpha (2-3) transcalidase. The method can be used for producing slaly1-oligosaccharides, anch as (2-3) slalyllactose for pharmaceutical luse. (2-3) slalyllactose for pharmaceutical luse. (2-3) slalyllactose for pharmaceutical luse. (2-3) slalyllactose and salmonella. It has also been shown that alpha (2-3) (2-3) slalyllactose (alpha-Neusoka-(2-3)-Gal-beta-(1-4)-Glc) interferes with colonisation of Helicobacter pylori and thereby prevents or inhibits gastric and duodenal ulcers. (2-3) sialyllactose has additionally been proposed to inhibit immune complex formation by disrupting occupancy of the Fc carbohydrate binding site on IgG and to be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SLIDTVAKYSVDDGETWETQIAIKNSRASSVSRVVDPTVIVKGNKLYVLVGSYNSSRSYW 140

                                                                                                                                                             ઠે
                                                                                                               The invention relates to a T. cruzi trans-sialidase (TS) derived neurotrophic peptide appearing as ADC21513 or ADC21511 called C44 and C14, or its variant, and an interleukin-6 (IL-6) secretion inducing peptide appearing as ADC21531 called TR-1 (terminal repeat 1). Also included are a composition comprising the peptides and a fusion partner, a composition comprising the peptides and a fusion partner, a composition comprising the fusion protein and a physiological acceptable carrier, providing trophic support for neurons or gilal cells in a mammal (comprising administering a therapeutically effective amount of T. cruzi transcalministering at the fusion partner of mammal (comprising administering a caministering a therapeutically effective amount of T. cruzi transcalministering of IL-6 (interleukin-6) in a mammal comprising administering or an IL-6 inducing variant. The fusion partner comprises a mammalian neurorrophic factor which is ciliary neurotrophic factor (LIF). The peptides are useful in providing trophic support for neurons and glial cells in a mammal suffering a condition selected from: amyotrophic lateral sclerosis, Alzheimer's disease, Paxinson's disease, Chagae disease, chagae disease, peripheral neuropathy, palsies, multiple sclerosis, stroke, brain trauma, spinal cord trauma and peripheral nerve trauma, and in stimulating the secretion of IL-6. The present sequence represents trans-sialidase clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;
                                      T. cruzi trans-sialidase derived neurotrophic and interleukin-6 secretion inducing peptides, useful in the treatment of neuronal degeneration caused for example by Chagas' disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          139

The invention relates to a T. cruzi trans-sialidase (TS) derived neurotrophic peptide appearing as ADC21513 or ADC21511 called C44 and neurotrophic peptide appearing as ADC21531 or ADC21511 called C44 and C14, or its variant, and an interleukin-6 (IL-6) secretion inducing peptide appearing as ADC21531 called TR-1 (terminal repeat 1). Also included are a composition comprising the peptides and a fusion partner, a composition comprising the fusion protein and a physiological acceptable carrier, providing trophic support for neurons or gilal cells in a mammal (comprising administering a therapeutically effective amount of T. cruzi transaluliase (TS) or a neurotrophic variant) and stimulating (M3) the secretion of IL-6 (interleukin-6) in a mammal comprising administering TS or an IL-6 inducing variant. The fusion partner comprises a mammalian neurotrophic factor which is ciliary neurotrophic factor (CNTF) or neurotrophic factor (LIF). The peptides are useful in providing trophic support for neurons and gilal cells in a mammal suffering a condition selected from: amyotrophic lateral sclerosis, Alzheimer's ginal cord trauma and peripheral nerve trauma, and in stimulating the secretion of IL-6. The present sequence represents trans-sialidase clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T. cruzi trans-sialidase derived neurotrophic and interleukin-6 secretion inducing peptides, useful in the treatment of neuronal degeneration caused for example by Chagas' disease.

RESULT 7 ADC21529 26-SEP-2002.

```
The invention relates to a T. cruzi trans-sialidase (TS) derived

CC neurotrophic peptide appearing as ADC21513 or ADC21511 called C44 and

CC (14, or its variant, and an interleukin-6 (IL-6) secretion inducing

CC oppride appearing as ADC21531 called TR-1 (terminal repeat 1). Also

CC comprising the peptides and a fusion partner, a composition comprising

CC comprising the peptides and a fusion partner, a composition comprising

CC defining therapeutically effective amount of T. cruzi trans-

CC daministering a therapeutically effective amount of T. cruzi trans-

CC an IL-6 inducing variant. The fusion partner comprising secretion of IL-6 (interleukin-6) in a mammal comprising administering TS

CC or an IL-6 inducing variant. The fusion partner comprises a mammalian

CC or an IL-6 inducing variant. The fusion partner comprises a mammalian

CC leukaemia inhibitory factor (LIF). The peptides are useful in providing

CC leukaemia thubitory factor (LIF). The peptides are useful in providing

CC condition selected from: amyotrophic lateral sclerosis, Alzheimer's

CC diesase, Parkinson's disease, Huntington's disease, Chagas 'disease,

CD eripheral neuropathy, palsies, multiple sclerosis, Alzheimer's

CD epripheral neuropathy, palsies, multiple sclerosis, Alzheimer's

CD epripheral neuropathy, palsies, multiple sclerosis, brain trauma,

CC catalytically active fragment TS 154.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a 1. cruzi transferent case (12.) derived

neurotrophic peptide appearing as ADC21513 called (44 and
C14, or its variant, and an interleukin-6 (IL-6) secretion inducing
c14, or its variant, and an interleukin-6 (IL-6) secretion inducing
c15 peptide appearing as ADC21511 called TR-1 (terminal repeat 1). Also
c16 included are a composition comprising the peptides, fusion protein
c0 included are a composition comprising the fusion pratient, a composition comprising
c0 included are a partial a protein and comprising comprising the fusion protein and a physiological acceptable carrier, providing
c1 trophic support for neurons or glial calls in a mammal (comprising
c1 daministering a therapeutically effective amount of T. cruzi trans-
c2 sialidase (TS) or a neurotrophic variant) and stimulating (M3) the
secretion of IL-6 (interleukin-6) in a mammal comprising administering TS
c1 an IL-6 inducing variant. The fusion partner comprises a mammalian
c2 neurotrophic factor which is ciliary neurotrophic factor (CTF) or
leukaemia inhibitory factor (ILF). The peptides are useful in providing
c1 trophic support for neurons and glial calls in a mammal suffering a
condition selected from: amyotrophic lateral sclerosis, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                              T. cruzi trans-sialidase derived neurotrophic and interleukin-6 secretion inducing peptides, useful in the treatment of neuronal degeneration caused for example by Chagas' disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disease, Parkinson's disease, Huntington's disease, Chagas' disease, peripheral neuropathy, palsies, multiple sclerosis, stroke, brain trauma, spinal cord trauma and peripheral nerve trauma, and in stimulating the secretion of IL-6. The present sequence represents the trans-sialidase catalytically inactive fragment TS H32 (has 6 substitutions in the

This is encoded by a full length coding sequence from strain Y of T. cruzi. This sequence is used to construct a recombinant T. cruzi CRP enkaryotic expression cassette. Recombinant CRP produced from host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  can be used as a vaccine to prime the immune system of an animal. Hybridomas secreting monoclonal antibodies recognising CRP are produced. This is used to detect Chagas's disease-related proteins and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      new vector encoding Trypanosoma cruzi complement regulatory protein,

mammalian decay accelerating factor gene; DAF; plasmid pBG12BI-CRP/DAF;
recombinant CRP eukaryotic expression cassette; Chagas' disease; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a modified Trypanosoma cruzi complement regulatory protein. The carboxy terminal end was modified to promote surface production in mammalian cells. The predicted GPI anchor addition site was removed and replaced with the C-terminal sequence of mammalian decay accelerating factor gene, which is recognised by mammalian cells. This was used in the construction of the plasmid pBC12BI-CRP/DAP for production of recombinant CRP in mammalian cells. Recombinant CRP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Clones 121 and 151, isolated from T.cruzi DNA library by homology to known neuramidase sequences, were found to have identical sequences in the region of the trans-sialidase gene necessary for enzymatic activity. The 121/151-encoded amino acid sequence (AAR42015) is similar to the known TCNA sequence (AAR42016) but distinct from the sequence encoded by clone 154 (AAR42017). (Updated on 25-MAR-2003 to correct PN field.)

Clones 121 and 151, isolated from T.cruzi DNA library by homology to thown neuramidase sequences, were found to have identical sequences in the region of the trans-stalidase gene necessary for enzymatic activity. The 121/151-encoded amino acid sequence (AAR42015) is similar to the known TCNA sequence (AAR42016) but distinct from the sequence encoded by clone 154 (AAR42017). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                           New trans-sialidase polypeptide(s) isolated from Trypanosoma - used for transferring sialic acid or for treating or preventing trypomastigote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Diagnosing Trypanosoma cruzi infection by detecting antibodies to novel antigens - which are useful in vaccines to provide protective immunity against Chagas' disease.

                                                                                                                                                                                                                                                                                                                                                           Clones 121 and 151, isolated from T.cruzi DNA library by homology to known neuramidase sequences, were found to have identical sequences in the region of the trans-sialidase gene necessary for enzymatic activity. The 121/151-encoded amino acid sequence (AAR42015) is similar to the known TCNA sequence (AAR42016) but distinct from the sequence encoded by clone 154 (AAR42017). (Updated on 25-MAR-2003 to correct PN field.)

This polypeptide sequence comprises a full-length antigen of Trypanosoma cruzi, identified by sequencing a DNA clone (see AAT65167) obtained by screening a Trypanosoma cruzi genomic expression library with pools of sera from infected individuals. T. cruzi antigens (see AAW25530-41), or AAW26542-44) of native antigens, can be used in a variety of immunoassays for detecting T. cruzi infection in a blood, serum, plasma, saliva, cerebrospinal fluid or urine sample. The polypetides are also useful in vaccines and pharmaceutical compositions for inducing protective immunity against Chagas disease. They can be produced by expression in transformed or transfected host cells. (Updated on 17-OCT-2003 to standardise OS field) X88888888888888888888888

du Polymorphisme Humain (CEPH), Paris, France. Briefly, Trypanosoma cruzi (C.Brener agarose embedded DNA (bhtained from Dr. Franco da Silveira) was partially digested with Hin dIII. High molecular weight fragments were ligated in BabeloBACII digested with Hin dIII. The average insert size is 1100 kb. Total clone coverage: approx. 33 X the haploid genome."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                652 bp DNA linear GSS 13-JUN-2002

/note="Vector: pBeloBAC11; Site 1: Hin dIII; Constructed for Uppsala University by Marie-Christine Le Paslier in the laboratory of Denis Le Paslier at the Centre d' Etude du Polymorphisme Humain (CEPH), Paris, France. Briefly, Trypanosoma cruzi (CI-Brener agarose embedded DNA (obtained from Dr. Franco da Silveira) was partially digested with Hin dIII. High molecular weight fragments were ligated in pBeloBAC11 digested with Hin dIII. The average insert size is 100 kb. Total clone coverage: approx. 33 X the haploid genome."

Briefly, Trypanosoma cruzi CL.Brener agarose embedded DNA (obtained from Dr. Franco da Silveira) was partially digested with Hin dIII. High molecular weight fragments were ligated in pBeloBACI1 digested with Hin dIII. The average insert size is 100 kb. Total clone coverage: approx. 33 X the haploid genome."

/note="Vector: pBeloBAC11; Site_1: Hin dIII; Constructed for Uppsala University by Marie-Christine Le Paslier in the laboratory of Denis Le Paslier at the Centre d'Etude du Polymorphisme Humain (CEPH), Paris, France. Briefly, Trypanosoma cruzi CL-Brener agarose embedded DNA (obtained from Dr. Franco da Silveira) was partially digested with Hin dIII. High molecular weight fragments were ligated in pBeloBAC11 digested with Hin dIII. The average insert size is 100 kb. Total clone coverage: approx. 33 X the haploid genome."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            433 GATGCGAGAGACTGGGATATTCTGCTTGCTTGGTGAGGTCACGAAGTCCACTGCGGGC 492

/note="Vector: pBeloBAC11; Site 1: Hin dIII; Constructed for Uppsala University by Marie-Christine Ie Paslier in the laboratory of Denis Le Paslier at the Centre d'Etude du Polymorphisme Aumain (CEPH), Paris, France. Briefly, Trypanosoma cruzi (L-Brener agarose embedded DNA (obtained from Dr. Franco da Silveira) was partially digested with Hin dIII. High molecular weight fragments were ligated in pBeloBAC11 digested with Hin dIII. The average insert size is 100 kb. Total clone coverage: approx. 33 X the haploid genome."

Sequences were basecalled with phred and vector was masked with crossmatch (see http://genome.washington.edu). Sequences were the trimmed from both ends to remove low quality bases and masked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 CGCATITATAAACGTTGGGGAAGTATTCATTGGTGATGAAAATGCCGCCTACAGCTCCGTC

/wore="Vector: pBelobaC11; Site_1: Hin dIII; Constructed
for Uppsala University by Marie-Christine Le Paslier in
the laboratory of Denis Le Paslier at the Centre d'Etude
du Polymorphisme Humain (CEPH), Paris, France. Briefly,
Trypanosoma cruzi (L.Brener agarose embedded DNA (obtained
from Dr. Franco da Silveira) was partially digested with
Hin dIII. High molecular weight fragments were ligated in
pBelobaC11 digested with Hin dIII. The average insert
size is 100 kb. Total clone coverage: approx. 33 X the
haploid genome."

Sequences were then trimmed from both ends to remove low quality bases and masked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Euglen.

Eukaryota; Euglen.

Trypanosoma; Schizotrypanum.

1 (bases 1 to 364)

Aguero, F., Verdun, R., Frasch, A.C.C. and Sanchez, D.O.

A random sequencing approach for the analysis of the trypanosoma cruzi genome: general structure, large gene and repetitive DNA families, and gene discovery

Genome Res. 10 (12), 1996-2005 (2000)

| /db_xxef="weator: pBeloBACI1; Site 1: Hin dIII; Constructed for Uppsala University by Marie-Christine Le Paalier in the laboratory of Denis Le Pasier at the Centre d'Etude du Polymorphisme Humain (CEPH), Paris, France. Briefly, Trypanosoma cruzi CL-Brener agarose embedded DNA (obtained from Dr. Franco da Silveira) was partially digested with Hin dIII. High molecular weight fragments were ligated in pBeloBACI1 digested with Hin dIII. The average insert size is 100 kb. Total clone coverage: approx. 33 X the haploid genome."

                                    CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in algigosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.

DEVELOPMENTAL STAGE: Mammalian stage of parasite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hydrolase; Glycosidase; Repeat; Multigene family; Antigen; Signal.
SIGNAL 1 23 POTENTIAL.
                                                                                                                                               MISCELLANBOUS: The parasite mammalian stage surface antigen exhibits extensive antigenic diversity.
SIMILARITY: Belongs to family 33 of glycosyl hydrolases.
SIMILARITY: Contains 2 BNR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23.2%; Score 815; DB 1; Length 752;

Microbiol. 135:3087-3096(1989).
- FUNCTION: SIALIDASES HAVE BEEN SUGGESTED TO BE PATHOGENIC FACTORS IN MICROBIAL INFECTIONS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -1 - CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal stalic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
-1 - SUBCELLULAR LOCATION: Periplasmic.
-1 - PTW: IT IS POSSIBLE THAT THE SIALIDASE IS CLEAVED IN FRONT OF A CYSTEINE WHITHIN THE LEADER PEPTIDE, FORMING A GLYCERIDE THIOETHER BOND WHICH LINKS THE PROTEIN TO THE MEMBRANE. A SECOND PROTEOLYTIC CLEAVAGE RELEASES THE MATURE EXTRACELLULAR FROTEIN.
-1 - SIMILARITY: Belongs to family 33 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                        Bacteria; Firmicutes; Clostridia; Clostridiales; Clostridiaceae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rothe B., Roggentin P., Frank R., Bloecker H., Schauer R.; "Cloning, sequencing and expression of a sialidase gene from Clostridium sordellii G12.";

MEDLINE=90324879; PubMed=1695668;

Kahn S., van Voorhis W., Elsen H.;

The major 85-kb surface antigen of the mammalian form of Trypanosoma cruzi is encoded by a large heterogeneous family of simultaneously expressed genes.";

J. Exp. Med. 172:589-597 (1990).

-!- FUNCTION: Developmentally regulated neuraminidase implicated in parasite invasion of cells. May contribute to the pathology during T.cruzi infection by cleaving sialic acid from cells of the immune

-1- SUMCELLULAR LOCATION: Periplasmic.
-1- SIMILARITY: Belongs to family 33 of glycosyl hydrolases.
-1- SIMILARITY: Contains 4 BNR repeats.
-1- SIMILARITY: Contains 1 F5/8 type C domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Clostridium septicum.

                                                                                                                                                                                                                                                                                                                                                   alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic subtrates.
SUBCELLULAR LOCATION: Periplasmic.
SIMILARITY: Belongs to family 33 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

--- CATALYTIC ACTIVITY: Hydrolygis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
--- SIMILARITY: Belongs to family 33 of glycosyl hydrolases.
--- SIMILARITY: Contains 4 BNR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
